

# Vexcel Announces UltraMap Server

Vexcel Corporation (CO, USA) has announced the release of the UltraMap Server digital archive, catalogue and post-processing system. Based upon proven image archive and catalogue technology, the system is fully integrated into the mapping workflow of the Vexcel UltraCam large format digital aerial camera and provides solutions for managing large volumes of digital images. The result is full-frame colour and multispectral imagery ready for client delivery and production.

UltraMap Server is available in configurations built on the same robust software infrastructure but provides users with storage and post-processing options suitable to their particular production needs. Configurations are easily upgraded with additional processing and storage components, providing varying levels of automation as well as flexibility to address the changing demands of a growing operation. Components include a robotic tape archive, a tape archiving management application, and the UltraMap Server Manager and Processor programs, all controlled via a single Graphical User Interface that can be accessed remotely through a web browser. An optional Mobile Server Unit is available to facilitate data transfer from the UltraCam to the UltraMap Server.
