

# YellowScan Launches CloudStation Software

YellowScan, a France-based UAV-Lidar solutions provider, has released CloudStation. This new software provides a complete solution to create and manipulate point-cloud data. It allows users to extract, process and display data immediately after flight acquisition. The auto-generation of flight lines and the production of LAS files can now be done in a few clicks.

"This launch allows a better and simplified experience for the customers," said Tristan Allouis, chief technical officer at YellowScan, before adding: "Better user experience leads to more efficiency for our demanding clients' projects."

Key business benefits that can be achieved from using CloudStation include checking data integrity in the field, verifying area coverage and making sure that all objects being mapped are identified. Additionally, according to YellowScan, the software solution enables extraction of LAS files within just a few minutes

CloudStation is immediately available with the acquisition of a YellowScan Lidar solution. For more information on YellowScan, [see here](#).
