

What is GEODI ?

GEODI is a smart search engine that works on your own data. With its innovative structure, it offers solutions in many different areas. It does not tire its users out with additional tasks. No additional data inputting is required; it works with your existing data as it is and where it is. Moreover, it uses Natural Language Processing and Artificial Intelligence techniques to perform a range of tasks that you would otherwise do yourself.

First and foremost, GEODI allows you to run a search from a single point. Its search capabilities are very close to those of world-famous search engines, such as Google and Bing. However, GEODI works on your own data. Another important difference is the file types it supports: GEODI supports many more file types, including CAD documents, e-mails, and databases.

Research shows that:

40%

Office staff spend 40% of their time searching for things.

10%

Time lost in searching accounts for 10% of the costs of institutions and companies.

GEODI will save you both time and money.

IT HAS NEVER BEEN SO EASY
TO ACCESS YOUR CONTENT

Automatic data retrieval

The ability to search makes your work very easy if you know exactly what you are looking for. However, just as it is not possible to know some things in advance, neither is it possible to find some things using a precise search. With its automatic data retrieval feature, GEODI is one step ahead in this respect . With GEODI, you reach information before you even begin to search for it.

GEODI retrieves and presents many kinds of data in advance – persons, ID numbers, parcels, distances, neighborhoods, item numbers, bank account numbers, dates, provinces, districts, countries, credit card numbers, company names, schools, shipment numbers, part numbers and many other such items.

Access all data from a single point

From a legal file, the names of people, clauses of law and similar information are all picked out. In a tender document, GEODI automatically identifies people, parcels, parks, streets and municipal units. In a progress report, item numbers, distances, place names, contractor names, individuals and e-mails are categorized automatically.

Information such as parcel numbers cannot always be found by a conventional search. GEODI recognizes the expression “305 block parcels 1-2 and 5” as three different and separate parcels. You would be very fortunate to find “305 block parcel 2” using a regular search engine. Searching and finding people in images, or products on a market shelf, are features that carry GEODI way beyond standard searching.

GEODI;

- *Suitable for personal and corporate use*
- *Mobile, web, desktop*
- *Access all content from a single point*
- *Automatic information retrieval*
- *See your documents on the map*

Picks out information from multiple sources.

Access by map

GEODI's features are not limited to searching. It can also display everything that relates to a location, including text, in map form. It provides access to information via a map. Thus, in addition to the textual connections among different pieces of information, you are also able to see their positional relations.

Opening different formats

Let's say you have found what you were searching for. This information may exist on a PDF, DWG, or NCZ (CAD) file, or even on a web page, in your e-mail, or in a ZIP file attached to an e-mail.

When there are many types of content, it gets harder to manage them. GEODI allows you to make notes on all kinds of content to facilitate your work .

A road construction company will be able to see the kilometer marks in all kinds of files on the map, and select the points drilled easily.

Similarly, a municipality will be able to view commission decisions, citizen complaints, the public housing archive or expropriation cases on a map. Many inquiries may be made about existing documents without need for any data inputting.

GEODI can open and display files in all these formats. There is no need for any other software.
